

# Weather Tools / getWeather.py

Andrew Ross  
09 Jul 2011

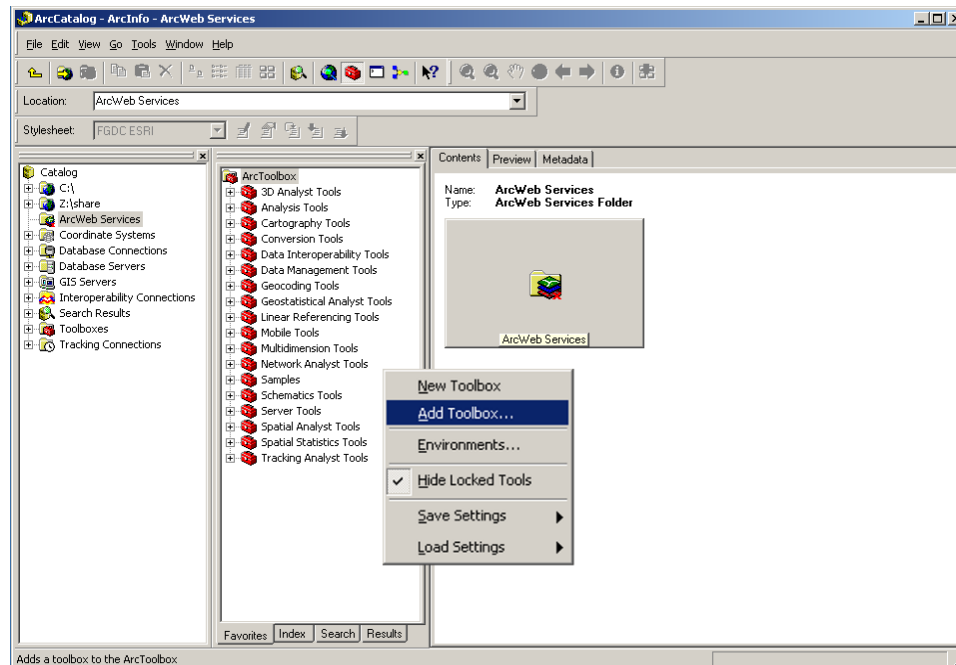

This python script creates a feature class containing the current weather for cities in a given Canadian province. The features are points with geographic coordinates. Attributes contain temperature, humidity, and chance of precipitation. The weather data is obtained from the RSS feeds at [www.weathernetwork.com](http://www.weathernetwork.com). The getWeather.py script can also be used from the command line.

Written for ArcGIS version 9.x.

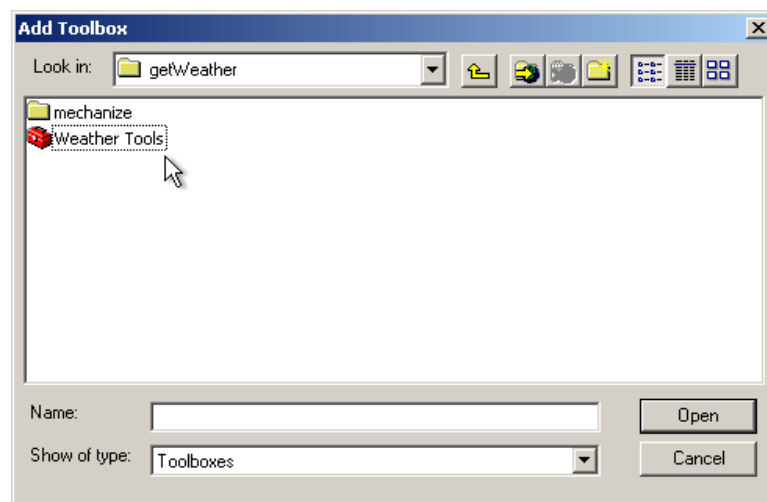

Comments and discussion at github: <http://github.com/geoR/getWeather/>

## Installation:

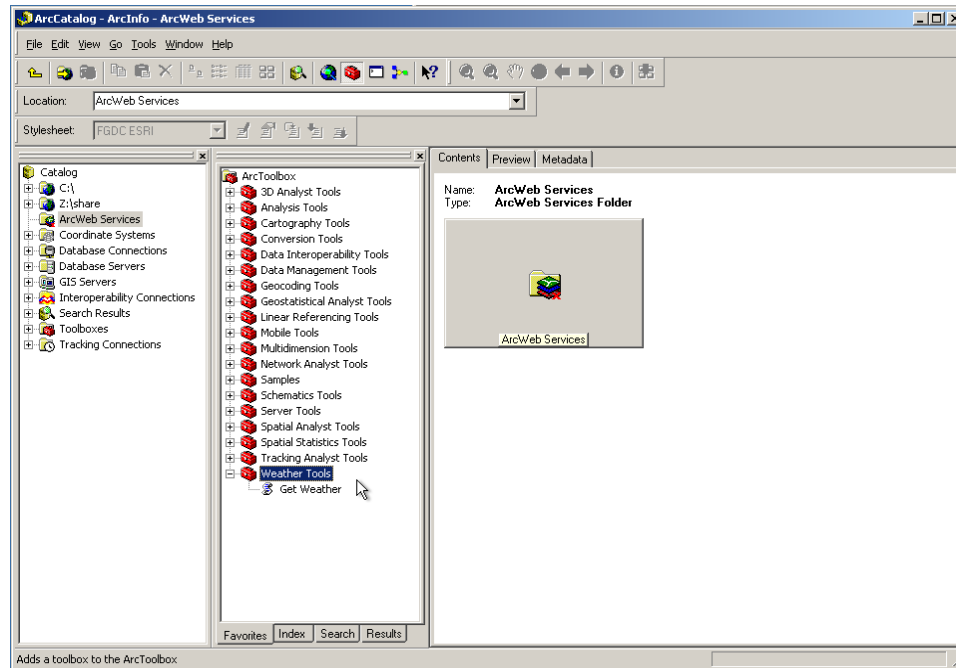

1. Unzip archive. Choose a fixed or permanent location.
2. In ArcCatalog and/or ArcMap, right click on the Toolbox pane and select Add Toolbox...

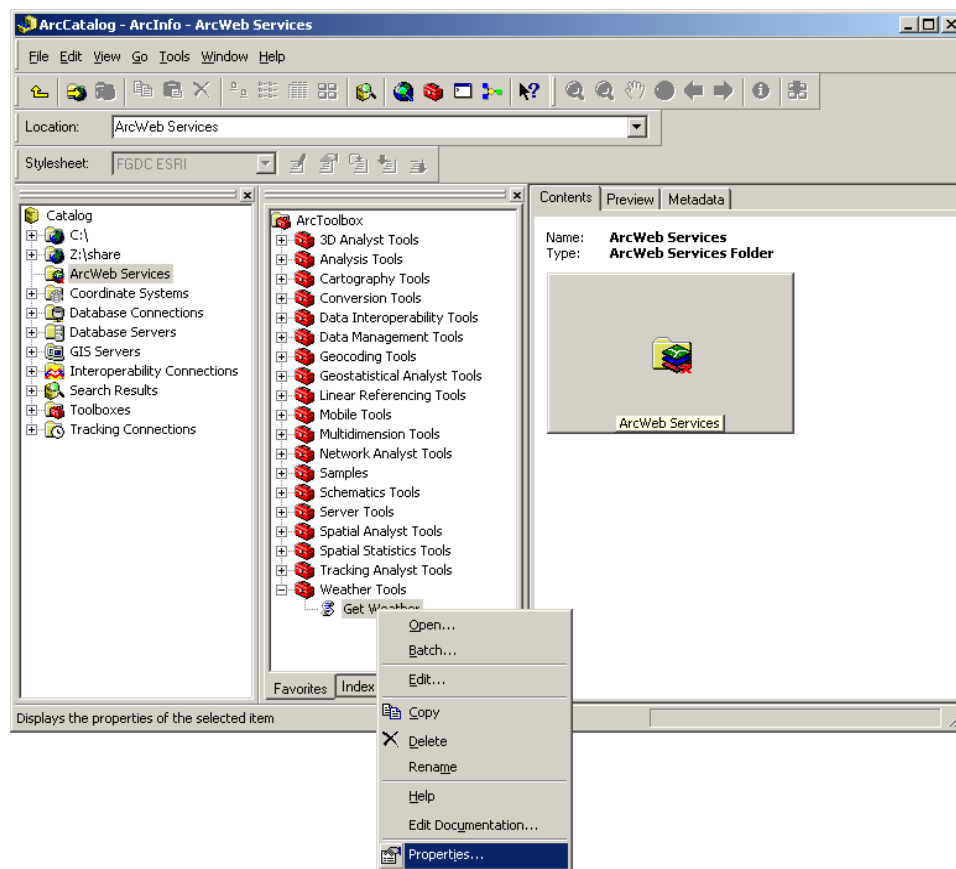

3. Navigate to the unzipped getWeather folder, and select the Weather Tools toolbox.

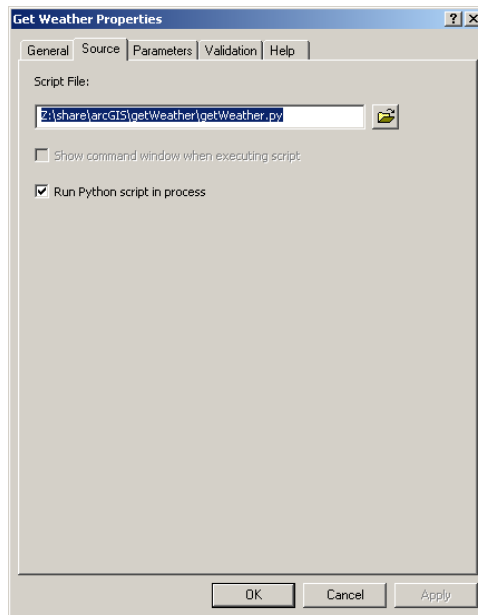

4. The Weather Tools toolbox will now be visible in the Toolbox pane, with the Get Weather script.

5. Ensure the script's path is set properly. Right click on the Get Weather script and select Properties.

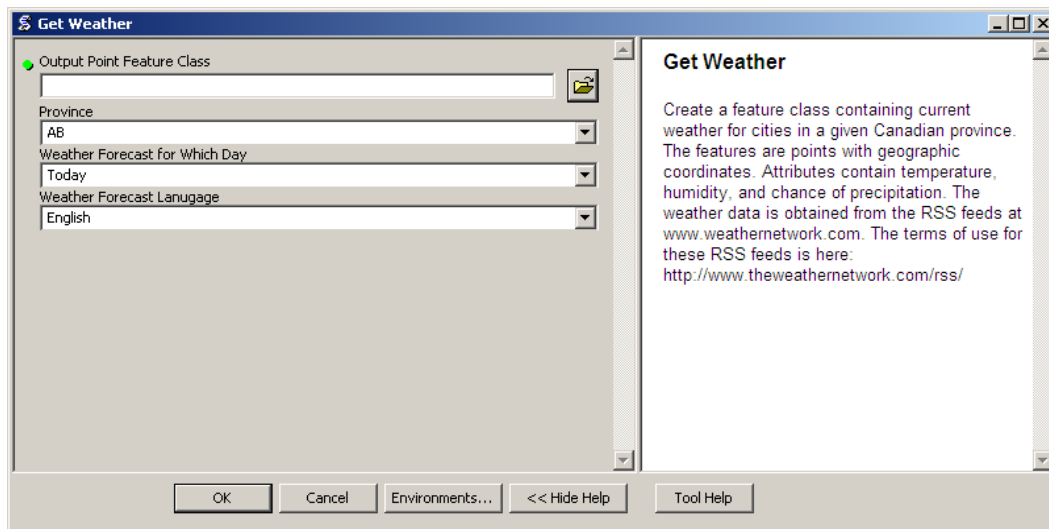

6. On the Source tab locate the getWeather.py script, found in the installation folder.

These steps will need to be repeated for both ArcCatalog and ArcMap.

### Usage:

Double click the Get Weather script to launch its dialog box. There are four parameters and help is provided for each one.

- **Output Point Feature Class:** Name of new Feature Class. An existing feature class will be overwritten.
- **Province:** Two-letter province code - AB BC MB NB NL NS NT NU ON PE QC SK YT .
- **Weather Forecast for Which Day:** Today, Tomorrow, Day after tomorrow, or The day after the day after tomorrow.
- **Weather Forecast Language:** English or French.

The attributes of the output feature class depend upon the "Weather Forecast for Which Day" parameter. This is due to the information available from the RSS feeds.

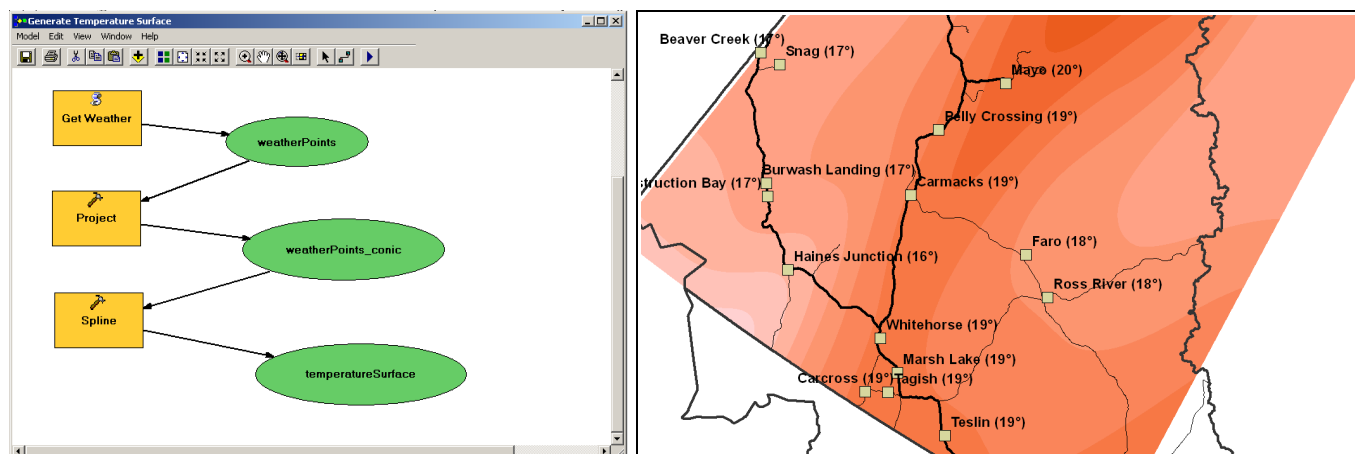

"Weather Forecast for Which Day"	Output Feature Class Attributes
Today	PROV, NAME, WEATHER, TEMP, HUMID, LAT, LON
Tomorrow	
Day after tomorrow	PROV, NAME, WEATHER, HIGH, LOW, POP, LAT, LON
Day after the day after tomorrow	

For example, "today" and "tomorrow" attribute tables for Yukon are:

OBJECTID *	Shape *	PROV	NAME	WEATHER	TEMP	HUMID	LAT	LOH
1	Point	YT	Snag	A few clouds	12	77	62.39924	-140.3717

This script can be used within model builder. For example this model creates a temperature surface from the city points.

This script can also be used from the command line useful for executing at scheduled times. All parameters are mandatory. The syntax is:

```
getWeather.py <outputFeatureClass> <provinceCode> <day> <language>
```

For example:

```
getWeather.py "C:\\data\\bcWeather.shp" BC today english
```

## File List:

- **getWeather.py**: Main script.
- **GPLv3.txt**: License
- **Weather Tools.tbx**: ArcGIS toolbox file, containing parameter configuration and help text.
- **cityList.csv**: Used to geocode cities. Will need to be updated if new cities are added.
- **Mechanize folder**: Module for getting URLs. See <http://wwwsearch.sourceforge.net/mechanize/>
- **mechanize-0.2.5.zip**: Mechanize archive included for reference. Can be deleted.
- **BeautifulSoup.py**: Module for parsing XML. See <http://www.crummy.com/software/BeautifulSoup/>
- **BeautifulSoup-3.2.0.tar.gz**: BeautifulSoup archive included for reference. Can be deleted.
- **GPLv3.txt**: License

Name	Size	Type
mechanize		File Folder
BeautifulSoup-3.2.0.tar.gz	31 KB	GZ File
BeautifulSoup.py	78 KB	Python File
cityList.csv	145 KB	CSV File
getWeather.py	9 KB	Python File
GPLv3.txt	35 KB	Text Document
mechanize-0.2.5.zip	435 KB	Compressed (zippe...)
Weather Tools.tbx	14 KB	TBX File

## Troubleshooting:

Ensure the path is set properly, as described in the setup above.

getWeather.py will not fail gracefully if there is no internet connection.

Errors are also generated if the Output Feature Class is already open in ArcMap or ArcCatalog. Ensure the Feature Class and geodatabase are closed to prevent locking.
